

# POWRMATIC

**Manufacturer moving to a hybrid cloud environment and implementing home worker solution.**

## Background

Since entering the market in 1949, Powrmatic have remained at the forefront of the commercial heating market. The challenge faced by Powrmatic was to keep certain elements of their IT on-premise in support of their manufacturing process, whilst also leveraging the efficiencies and advantages that Cloud solutions provide.

We worked with Powrmatic to design a new **Hybrid Cloud solution** that was simple to implement using our dedicated eCloud platform, connected back to the newly deployed on-premise servers.

The business benefits are around providing a solution with all the features that the users demand to make them as productive as possible. We built in resilience and speed, remote access using our **Citrix based 'Desktop as a Service' (DaaS) Citrix platform**, whilst supplying all of this in a cost-effective service.

The traditional 'on-premise' services are then backed up to the **Eloquent eCloud backup platform**, so if there is a major issue with the

existing hardware, we can re-start the services from the Cloud in our private and highly secure datacentre space.

During the migration process, we also tidied up some of the old legacy Microsoft 2008 servers and old network switching infrastructure. Because of the developing COVID-19 situation, the implementation stage of this project was condensed into 4 days, however this has given Powrmatic the ability to operate flexibly from home, or the office when required.
